

## Error Handling

Duplicate and null-hash errors while hashing and loading are caught, handled and logged. Technical Hash or load failures only affect the current table being populated, an error does not stop the entire load batch.

Failed datatype conversions while hashing result in null values being stored in the target columns, and the original non-converted value is then stored in a separate column. By running built-in error analysis commands these errors can be detected and reported.

***Conversion and referential integrity analysis***
