

## Orchestration

DSharp Studio is not needed to load the data, it only generates installable database objects.

Source system specific master procedures are generated for both hashing and loading the entire contents of the staging area for that source system. Top-level master procedures are generated for calling these source system specific procedures. Post processing like state changes, pit updates, materializations and generating derived classes are all included in the process.

Calling `_HashAll` and `_LoadAll` will load and process all contents in the staging area.

***Generated orchestration procedures***
