

Data Lineage (16.1)

Agile Data Engine provides a real-time, interactive data lineage view at entity level, based on defined entity loads.

Data lineage visual representation is maintained automatically based on the actual loads implementation, and is accessible on a data package level in ADE designer.

Data lineage can be also accessed from ADE Insights module or External API which enables integration with 3rd party tools like f.ex. data catalog solutions.

Data Lineage (16.2) - Package tree view

- Package tree view is a high-level lineage available on data packages level.
- Packages are groups of entities with loads associated to them and represent a unit of development and deployment.
- The view helps identify and manage dependencies between various layers f.ex. in the medallion architecture (gold-silver-bronze), such as info marts, curated entities, raw DV packages and data sources
