

Scheduling (18)

In ADE workflows can be scheduled in several ways:

- The most common way is to schedule them using cron expressions.
- When workflows have interdependencies, they can trigger upon the completion of their dependent workflows.
- Additionally, a workflow can be executed by itself.
- Integration with external tools allows running or checking workflow status via API calls. It is common to implement workflow execution in ADE based on certain cloud storage events (e.g. file arrival).
- For development, testing or fixing production runs, data loads can be manually triggered
